#### **AKS desde portal Azure**

#### Diego Iván Perea Montealegre

#### Ingreso de azure por medio del CLI

Aclarar que ya se debe tener instalado minikube , docker y kubernetes en maquina de vagrant (https://github.com/diegoperea20/SpecializationAI/tree/main/CloudComputing/week5/kubern etes-p)

## Agrega la clave GPG del repositorio de Azure:

curl -sL https://packages.microsoft.com/keys/microsoft.asc |  $\$  gpg --dearmor |  $\$ 

sudo tee /etc/apt/trusted.gpg.d/microsoft.asc.gpg > /dev/null

#### Agrega el repositorio de Azure CLI a la lista de repositorios de apt-get:

AZ\_REPO=\$(lsb\_release -cs)

echo "deb [arch=amd64] https://packages.microsoft.com/repos/azure-cli/ \$AZ\_REPO main" | \ sudo tee /etc/apt/sources.list.d/azure-cli.list

### Actualiza la lista de paquetes de apt-get e instala la CLI de Azure:

sudo apt-get update

sudo apt-get install azure-cli

```
Running kernel seems to be up-to-date.

No services need to be restarted.

No containers need to be restarted.

No user sessions are running outdated binaries.

No VM guests are running outdated hypervisor (qemu) binaries on this host.

```

az provider register -n Microsoft.Compute
az provider register -n Microsoft.ContainerService
az provider register -n Microsoft.Network
az provider register -n Microsoft.Storage

\$ az group create -n compunube --location eastus

~\$ az aks create --resource-group compunube --name microproyecto2 --node-count 2 --generate-ssh-keys --kubernetes-version 1.20.9 -- node-vm-size=Standard\_B2s

```
vagrant@servidorUbuntu:~$ az aks create --resource-group compunube --name microproyecto2 --node-count 2 --generate-ssh-keys
--kubernetes-version 1.20.9 -- node-vm-size=Standard_B2s
unrecognized arguments: -- node-vm-size=Standard_B2s

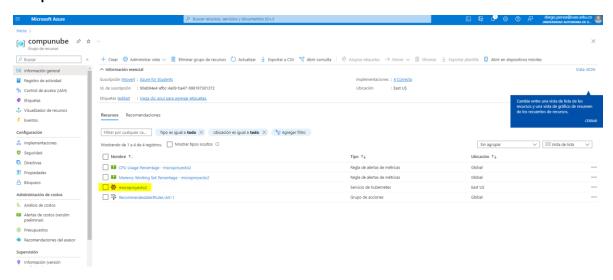

Examples from AI knowledge base:
az aks create --resource-group MyResourceGroup --name MyManagedCluster
Create a kubernetes cluster with default kubernetes version, default SkU load balancer (Standard) and default vm set type (V irtualMachineScaleSets).

az aks create --resource-group MyResourceGroup --name MyManagedCluster --enable-managed-identity
Create a kubernetes cluster which enables managed identity.

az extension add --name anextension
Add extension by name

Read more about the command in reference docs
vagrant@servidorUbuntu:~$ |
```

#### Comprobacion de creación cluster AKS

Acceso a cluster AKS mediante Cloud Shell en Portal Azure

#### Acceso a cluster AKS mediante CLI Azure desde maquina local

az login

se compia y pega lo mismo que se hizo en powershell

# 2.CLASIFICADOR DE IMÁGENES CLI AZURE

Se hace git clone al repo https://github.com/diegoperea20/SpecializationAl.git

y se mueve "Clasification\_and\_Guestbook\_elements" hacia root

https://github.com/diegoperea20/SpecializationAl/tree/main/CloudComputing/week6/miniproject2/Clasification and Guestbook elements

y se elimina lo demás

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ az account set --subscription 90ab94e4-afbc-4a09
-ba47-698197301372
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ az aks get-credentials --resource-group compunub
e --name microproyecto2
Merged "microproyecto2" as current context in /home/vagrant/.kube/config
```

kubectl apply -f deployment.yaml

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ kubectl apply -f deployment.yaml
deployment.apps/kubermatic-dl-deployment created
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$
```

\$ kubectl expose deployment kubermatic-dl-deployment --type=LoadBalancer --port 80 -- target-port 5000

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ kubectl apply -f deployment.yaml
deployment.apps/kubermatic-dl-deployment created
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ kubectl expose deployment kubermatic-dl-deployme
nt --type=LoadBalancer --port 80 --target-port 5000
service/kubermatic-dl-deployment exposed
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$
```

Verificar con kubectl get pods ,services y deployment esten configurados

kubectl get pods --all-namespaces

```

Finalmente hacemos dos pruebas con curl pasándole primero una imagen local de un perro para que la aplicación realice la predicción. La segunda prueba es otro curl, pero esta vez le pasamos una imagen de un caballo como vemos a continuación:

Colocar la external-ip de kubectl get services --all-namespaces

En este caso es EXTERNAL-IP = 20.88.167.60

\$ curl -X POST -F img=@dog.jpg http://EXTERNAL-IP/predict

\$ curl -X POST -F img=@dog.jpg http://20.88.167.60/predict

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ curl -X POST -F img=@dog.jpg http://20.88.167.60
/predict
The input picture is classified as [dog], with probability 0.974.vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ |
```

\$ curl -X POST -F img=@horse.jpg http://20.88.167.60/predict

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ curl -X POST -F img=@horse.jpg http://20.88.167.
60/predict
The input picture is classified as [horse], with probability 0.864.vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Clasificador$ |
```

#### 3. Aplicacion de interés Implementación del servicio web Guestbook Cli Azure

Aplicación guestbook-go: https://github.com/kubernetes/examples/tree/master/guestbook-go Ir a la carpeta Guestbook-go

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Guestbook-go$ ls
guestbook-controller.json redis-master-controller.json redis-slave-controller.json
guestbook-service.json redis-master-service.json redis-slave-service.json
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Guestbook-go$ |
```

Creacion de servicio Redis, (Servicio kubernetes como balanceador)

\$ kubectl apply -f redis-master-service.json

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Guestbook-go$ kubectl apply -f redis-master-service.json
service/redis-master created
```

Creación los pods esclavos de redis , controlador de responsable de manejar varias instacias de un pod duplicado

§ kubectl apply -f redis-slave-controller.json

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Guestbook-go$ kubectl apply -f redis-slave-controller.json
replicationcontroller/redis-slave created
```

Creacion servicio esclavo de redis, (balancea carga de clientes)

kubectl apply -f redis-slave-service.json

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Guestbook-go$ kubectl apply -f redis-slave-service.json service/redis-slave created
```

Creamos los pods del guestbook, los servicios maestro o esclavo dependiendo de si la solicitud es de lectura o escritura.

\$ kubectl apply -f guestbook-controller.json

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Guestbook-go$ kubectl apply -f guestbook-controller.json
replicationcontroller/guestbook created
```

agrupar los pods del guestbook para que sea visible externamente para que sea tipo baleanceador

\$ kubectl apply -f guestbook-service.json

```
vagrant@servidorUbuntu:~/Clasification_and_Guestbook_elements/Guestbook-go$ kubectl apply -f guestbook-service.json
service/guestbook created
```

Visualizar los pods, servicios y controladores

\$ kubectl get services

```
go$ kubectl get services
                            TYPE
                                           CLUSTER-IP
                                                          EXTERNAL-IP
                                                                            PORT(S)
                                                                                              AGE
                           LoadBalancer
                                           10.0.233.137
                                                           20.237.114.187
                                                                            3000:31677/TCP
                                                                                              61s
